

#### **Derme**

Healthcare Project 2019-2020

A mobile app designed to provide adults self-managing a skin condition with a greater sense of control.

Academic Lead

Gabriella Spinelli

Design Student

Katie Price

## The Challenge

Millions of adults suffer from chronic skin conditions, which require very high-levels of self-management to care for and keep under control. Currently, there are a lack of solutions for patients to use to aid their self-management, and longitudinally monitor dynamically changing conditions. Clinicians treating patients also lack vital knowledge and information about each individuals condition, resulting in less informed decision-making, creating frustration for both patients and clinicians.

This project aimed to design a tool for adults to easily integrate into their lifestyles to help them manage their skin condition, its symptoms, treatments and its imacts on their lifestyle.

#### **Service Requirements**

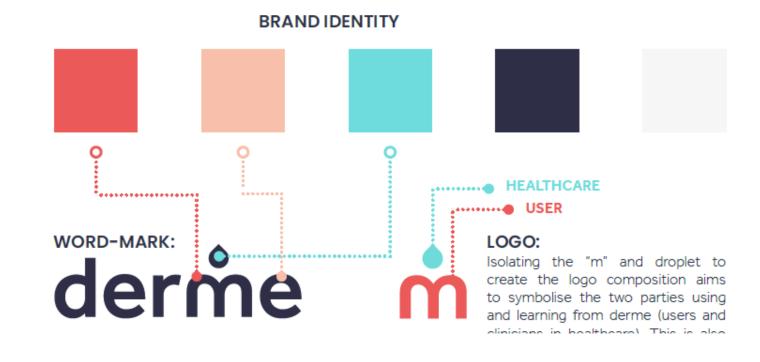

- The service must be suitable and safe for an adult with a chronic skin condition to use on a daily basis.
- The styling should not immediately reflect a medical product.
- The service must be intuitive to use.
- The service must be provided as a self-management tool for the user to help control their condition.
- The service must promote a healthy change in behaviour when treating the skin, to encourage regular use of treatment and medication in a prescribed regime.
- The service must be able to better document and track the skin condition

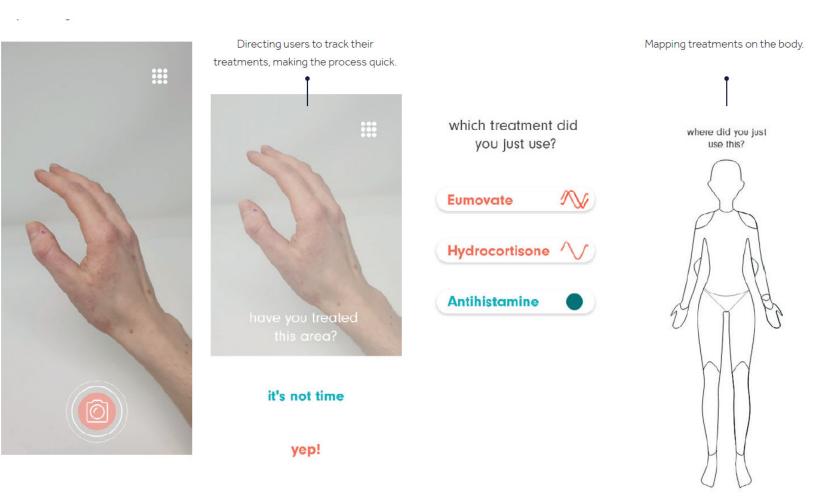

## **Ideation and Development**

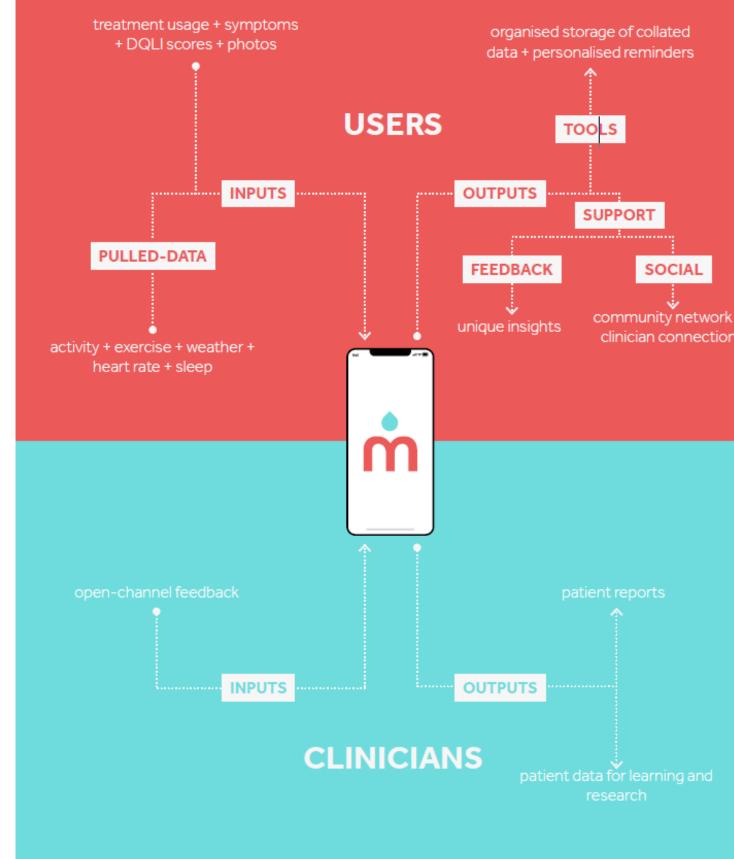

# **Final Prototype**

#### Derme app Blueprint

Create a fuller, more accurate picture of conditions by capturing symptom changes, treatments and its impact on the user's lifestyle
